

ABSTRACT OF THE DISCLOSURE

A spray device includes a spray mechanism and a reservoir containing a substance for spraying. For example, the substance may be a cosmetic or other care product. The reservoir is arranged so as to be capable of being removably mounted on the device so that the substance can be selectively dispensed by the spray mechanism. The reservoir includes a substance outlet passage and a closure member for closing the passage when the reservoir is not mounted on the device. The spray mechanism and the closure member are arranged so that the closure member opens in response to the reservoir being mounted on the device. The reservoir also includes at least a first partition and first and second compartments capable of containing the substance. The compartments are arranged to feed the spray mechanism with the substance and are disposed on either side of the first partition.
